1. GENERAL DESCRIPTION

The Viking FoamPak foam pump system incorporates a UL Listed and FM Approved positive displacement bronze/stainless steel rotary gear foam pump capable of dry operation. The balance valve, pressure relief valve, and piping products are all bronze or 316 Stainless Steel as standard materials. A UL Listed/FM Approved NEMA 2 foam pump controller, mounted and wired on the FoamPak, is included.

The Viking FoamPak, is a complete foam pumping system, equipped with supply and discharge piping (excluding the foam supply piping and foam return piping to the foam tank), auxiliary flushing connections, concentrate discharge check valve, pressure sustaining valve, pressure relief valve, concentrate supply strainer, foam pump and pump controller.

The rotary gear pump is of all bronze construction to withstand the corrosive atmosphere that exists with AFFF and AR-AFFF concentrates. The unique lip seal construction of the pump allows it to run dry without damage to the pump.

The Viking FoamPak is to be used anywhere a foam system that utilizes positive pressure proportioning (Viking ILBP) is desired or necessary. The Viking FoamPak can supply single or multiple foam systems with balanced pressure proportioning.

A. Application

The Viking FoamPak foam pumping systems are foam concentrate delivery devices. Viking FoamPak foam systems are a critical part of a low or high expansion foam system which includes the following applications: aircraft hangars, petro-chemical facilities, flammable and combustible liquid warehouses, tank farms, facilities for bulk storage of flammable or combustible liquids, offshore FPSO and shipboard applications and many military installations. The FoamPak systems can supply foam concentrate to concentrate injection piping run above or below ground.

B. Selection

The Viking FoamPak system is available in five basic sizes, available with four standard foam discharge pressure ratings, 100, 150, 200, 261 psi, (6.9, 10.3, 13.8, 18 bar). The FoamPak assembly flow rate capacity is selected based on the required flow rate per minute of foam concentrate and percentage of foam injection required for all special flammable liquid hazards.

The standard method of sizing the FoamPak capacity is by multiplying the area of the hazard by the required density, multiply that sum by the concentration of foam concentrate (1%, 2%, 3%), multiply that sum by a 1.15% safety factor for hydraulic over discharge and hydraulic balancing of the system piping. If the hazard required flow rate is known, meaning the hydraulic calculations for the hazard have been performed, multiply the total water flow by the percent of foam to be used.

The FoamPak assembly's pressure rating is selected after considering the pressure differential requirements of the ILBP, (Viking ILBP requires a minimum pressure differential of 15 psi (1 Bar)), added to the static water pressure available at the riser. The pressure rating of the FoamPak should be determined by adding in the pressure drop of the concentrate discharge piping attributed to the length of the concentrate piping from the FoamPak discharge connection to the most remote ILBP. The typical pressure rating of the system must exceed the residual water pressure to the most remote riser by 15 to 30 psi (1 to 2 Bar). You should select the next highest pressure rating pump.

C. Foam Pump Controller

The foam controllers are designed specifically for foam service and have the following alarms and functions as standard:

- Phase failure / phase reversal alarm
- Running period timer, factory set for 10 minutes
- Manual shut down only, emergency start push button
- Remote start terminal connection
- Deluge system starting contact
- Remote pump operating contact
- Remote power failure contact
- Start delay timer for a 2 pump operation system, primary/standby foam pumps
- Spare contacts for field wiring of additional pumps alarms
- Configured with an optional pressure proof switch
- Visible alarm – low concentrate level
- Standard NEMA 2 enclosure – options for NEMA 3R, NEMA 4 and NEMA 4X
- Foam pressure switch for loss of pressure automatic starting

TECHNICAL DATA

VIKING FOAMPAK (DUAL)

The Viking Corporation, 210 N Industrial Park Drive, Hastings MI 49058

Telephone: 269-945-9501 Technical Services: 877-384-5464 Fax: 269-818-1680 Email: techsvcs@vikingcorp.com

Visit the Viking website for the latest edition of this technical data page www.vikinggroupinc.com

Typical options that may be added to the above at an additional cost are:

- Anti-condensation space heaters for 120 volt or 240 volt, both single phase
- Automatic transfer switches to transfer to another power source
- Audible and visible pump on remote alarm contact / local light

D. FoamPak electrical details:

- All of the foam pump controllers are UL Listed and FM Approved.
- All controllers are manufactured specifically for foam pump service.
- All controllers are initially figured for a start signal or deluge signal starting method. If a pressure loss start method is desired, a foam pressure proofing switch is provided to initiate a "start signal" from loss of pressure or pressure drop using the foam pressure proofing switch that is standard.
- All controllers are either 50 Hz or 60 Hz service. Voltages of 200-208, 220/230, or 440-480 volt at 50 or 60 Hz are available at no additional cost but must be specified when ordering.
- All electric motor enclosures are either IP-45/ODP type or IP-55/TEFC rated. Many other motor enclosures are available such as IP65 ATEX- EEXD. Please contact Viking with the specific motor enclosure required if other than ODP IP-45 or TEFC/IP55.
- All foam pump controllers offered are NEMA 2 enclosure as standard and are included in the FoamPak for protected area installations. Other enclosure ratings are available such as NEMA 3R / 4x. UL Listed and FM Approved controllers are not available in explosion proof enclosures, however; ATEX certified enclosures are available. Contact Viking for more information.
- Standard controller starting method is cross the line or full voltage. Other reduced voltage options such as Y-delta or solid-state are available. Please contact Viking for a specific quote.
- All connecting wiring from the controller to the electric motor is complete and to NEMA standards.
- Motor service factors are sometimes used on certain FoamPak pressures and flow rates. Typically the electric motors have a 15% service factor. 10% or less of the motor service factor is used on some flow/pressure combinations.

E. FoamPaks with Diesel Engines

Sometimes electrical service is not available or unreliable. If the hazard site has questionable electrical conditions, a UL Listed and FM Approved low horsepower, radiator cooled diesel engine pump driver is available. UL Listed and FM Approved diesel engine manufacturers are Clarke, Cummins or Deutz. The standard pricing options for diesel engine drive are based on Clarke only.

Diesel powered FoamPak's are complete assemblies similar to the electrical operated units. Diesel engine packages are completely self-contained except for the battery charger power requirement of single phase, 110/220 volt, 50/60 Hz.

2. LISTINGS AND APPROVALS

The FoamPak is a pre-assembled collection of components and carries no approvals as a completed assembly. The major components are UL Listed and/or FM Approved. The FoamPak is UL Listed and/or FM Approved as part of a fire extinguishing system. The skid itself holds no listings or approvals.

UL Listed: Category EX27020

FM Approved: Category Pump, Foam Concentrate and Water or High Pressure Water Spray

ISO Approved to 9001:2015

3. TECHNICAL DATA

Foam Pump Piping and Controller by: Fire Lion Global, Vancouver WA, USA.

3.1 Construction Features

Maximum Pump Speed: 1800 RPM 60 Hz/1500 RPM 50 Hz

Connections (ANSI flange connections available upon request):

- FoamPak 5D – 1-1/2" (38 mm) Suction and 1" (25 mm) Discharge Grooved Connections
- FoamPak 13D - 2" (50 mm) Suction and 1-1/2" (38 mm) Discharge Grooved Connections
- FoamPak 26D – 3" (75 mm) Suction and 2" (50 mm) Discharge Grooved Connections
- FoamPak 50D - 4" (100 mm) Suction and 3" (76 mm) Discharge Grooved Connections
- FoamPak 59D - 5" (125 mm) Suction and 4" (100 mm) Discharge Grooved Connections
- Controller standard NEMA rating: NEMA 2, (other NEMA enclosures for motor and controller are available at additional cost.)
- Controller and pump motor voltage: 3 phase/60 Hz/460/480 volt, voltages of 200-208, 220/230, 380/415 at 50 or 60 Hz are available at no additional cost but must be specified when ordering.

3.2 Standard Materials:

See Section Spare Parts for material standards. All Piping is 316 Stainless Steel.

6. PRODUCT VARIANTS**6.1 Options**

- Controllers available: 220/230 V (limited to lower power Foampaks), 380/415 V, 460/480 V, 50 Hz, or 60 Hz
- Motors: ODP/IP45 with optional IP55 (TEFC), IP65 and EEXD ratings
- Jockey pump

6.2 Customized Options

- Flanged connections available upon request.
- Configurations available for electric duty: electric standby, diesel standby, and water powered standby.
- Factory Start up

7. INSTALLATION

The Viking FoamPak should be installed in accordance with NFPA standards and local requirements governing the installation of foam systems.

NOTICE

Positive pressure must be maintained at foam inlet in order to protect the system integrity and avoid cavitation of the pump(s). The following are recommended methods to maintain positive pressure:

- Ensure the level of the foam concentrate is higher than the pump inlet at all times.
- Minimize inlet piping lengths and restrictions (i.e. excess reducers/elbows, long runs of inlet piping, partially closed valves).
- Regularly inspect and clean the Y-Strainer to prevent blockage.

The Viking FoamPak assembly is supplied by an atmospheric storage tank (supplied by contractor) connected to the supply inlet of the skid assembly. The discharge outlet is connected to the concentrate piping supplying the proportioning devices (ILBP's), (concentrate piping and ILBP's installed by contractor).

The foam pump controller and foam pump motor are pre-wired on the skid. A power supply to the controller is required. The proper voltage, hertz, and phase are critical factors that must be available as they were specified upon ordering. Refer to Controller information on this data page.

To minimize FoamPak operating noise, it is recommended that the steel substructure is:

- securely anchored to a stable, flat surface using the mounting tabs welded on the skid
- leveled using shims under each mounting tab before mounting bolt nuts (not furnished) are tightened. It is essential the steel substructure not be twisted or bent in any way.

8. OPERATION

The Viking FoamPak pump assembly is supplied with a pump controller that starts the pump via a remote start signal when foam concentrate is required to be pumped to the hazard area(s). There are many methods of starting the foam pump. The most common is through a water pressure switch at the system riser. When the water pressure switch is activated, the foam pump controller will receive a signal to start operation.

Other methods include pressure drop, which requires a maintenance (jockey) foam concentrate pump that maintains a desired pressure in the foam concentrate piping. When the pressure drops in the concentrate piping to a point that the maintenance (jockey) foam concentrate pump cannot maintain the desired pressure, the main pump foam pressure switch sends a signal and starts the main foam pump. Maintenance (jockey) foam concentrate pumps are not standard with the Viking FoamPak, but can be ordered as a separate option.

The foam concentrate is supplied to the Viking FoamPak assembly through piping supplied by others connected to an atmospheric storage tank. The atmospheric storage tank can be a horizontal or vertical vessel. Most atmospheric foam storage tanks are of a cross-linked polyethylene construction. The foam concentrate storage tank is not pressurized. The foam concentrate is only under atmospheric pressure to the supply side of the Viking FoamPak.

When the Viking FoamPak is not equipped with a maintenance (jockey) foam concentrate pump, the discharge piping from the pump skid assembly to the In-Line Balanced Pressure Proportioner (ILBP), is full of foam concentrate, but not under pressure. When the pump controller receives a signal to start, the electric motor is energized, driving the rotary gear pump. The pump draws foam concentrate from the atmospheric tank and discharges the concentrate through the foam concentrate discharge piping network (installed by contractor) to the ILBP(s). The Viking FoamPak assembly is equipped with a pressure sustaining valve that is connected to a concentrate return line that is piped to a return connection located on the atmospheric storage tank. The return line connection should be located below the liquid level of the storage tank to minimize any foaming action caused by the agitation of the foam concentrate. The pressure sustaining valve is utilized to ensure the foam discharge pressure is maintained at a higher pressure than the water pressure, regardless of the foam usage requirement. Often the pump output exceeds the demand, thus using the pressure sustaining valve to return excess foam concentrate to the foam tank.

The FoamPak is equipped with a pump pressure relief valve that is piped to the concentrate return line past the pressure sustaining valve. The pump pressure relief valve is in place to ensure that if for any reason foam concentrate pressure increases to relief valve set point, the piping and components are protected from excessive pressure. The pump pressure relief valve will open at a pre-set pressure and direct foam concentrate back to the atmospheric storage tank.

NOTICE

Prior to or during start-up or pumping skid operation, the return to tank valves must all be open and locked open.

The pump pressure relief valve eliminates overheating and over-pressurization of the foam pump and piping in a dead head (no flow) or churn pressure condition.

The Viking FoamPak is equipped with primary and secondary supply and return connections. The primary supply connection is

utilized to take a supply from the atmospheric storage tank, the secondary supply connection is utilized to supply the pump with an auxiliary source of foam concentrate if needed or to supply the foam pump, valves and piping with clean water if flushing is required. The primary discharge connection is utilized to supply the concentrate piping to the ILBP piping network. The supply connection is equipped with a "Y" strainer to ensure that the foam concentrate or flushing supply entering the foam pump is free of debris.

9. GUARANTEES

For details of warranty, refer to Viking's current list price schedule or contact Viking directly. The Fire Lion UL/FM foam pump has a Life Time warranty from date of shipment.

10. INSPECTIONS, TESTS AND MAINTENANCE

WARNING

Any system maintenance or testing that involves placing a control valve or detection system out of service may eliminate the fire protection of that system. Prior to proceeding, notify all Authorities Having Jurisdiction. Consideration should be given to employment of a fire patrol in the affected area.

It is imperative that the Viking FoamPak is inspected and tested per the requirements of NFPA 20 and NFPA 25. Inspections, testing and maintenance of the Viking FoamPak is the owner's responsibility. The concentrate piping on the FoamPak is hydrostatically tested prior to delivery. The pump skid assembly is to be flushed in accordance with manufacturer's recommendations. The supply "Y" strainer screen should be examined and cleaned in accordance with NFPA 25, before each test.

11. DISPOSAL

At end of use the product described here should be disposed of via the national recycling system.
